Workshop Attendance and Assessment Implementation Criteria

Verified Teams attendance

ID and rule	Implementation and acceptance test
W01 Live workshops	W1, W2 and W3 are live Microsoft Teams sessions associated with Moodle Modules 1, 2 and 3. Verify module/session labels, date/time/time zone, joining link, resources and recording access where applicable. Course/calendar links identify the same session; check two time zones.
W02 Verification source	Use an OAPA-supported Teams attendance source mapped to the correct learner and workshop. Automatic capture is preferred where supported; verified Teams-report plus facilitator-controlled Moodle recording is permitted. Demonstrate source-to-learner/session matching. Missing, ambiguous or unverified records do not qualify.
W03 No self declaration or invented threshold	Link opening, viewing a recording or pressing Done cannot independently create qualifying attendance. Test all three. Do not impose minutes, attendance percentage, minimum joins or another duration threshold without client confirmation. The actual attendance-verification policy remains D-03 pending.
W04 Facilitator override	Retain an authorised facilitator route to verify/correct attendance or record an approved exception. Demonstrate the permission, learner/workshop selection, evidence or exception basis, saved qualifying state and resulting gate update. Preserve who authorised the action and its basis in test evidence; the exact operational record fields/process require confirmation. Keep exceptions distinguishable from actual attendance. Student-only users cannot grant themselves attendance or exceptions.
W05 Distinct and persistent records	Each learner contributes at most one qualifying result per workshop. Repeated joins/imports cannot turn W1 into two workshops. Test duplicate records, one learner against another, refresh and logout/login; learner and authorised staff states agree after the agreed update interval.

E01 Module progression and assessment eligibility

Default progression is M1 → M2 → M3 using approved module completion rules. Attendance eligibility is a separate hurdle: any two distinct qualifying workshops suffice. Do not require W1, W2 and W3 attendance as module-unlock prerequisites. A learner must be able to complete all modules with only two workshops attended.

Execute each attendance and module case	Expected access
All modules complete: none; W1 only; W2 only; W3 only	Blocked in all four
All modules complete: W1+W2; W1+W3; W2+W3; all three	Allowed in all four
Each of M1, M2 and M3 incomplete: each pair and all three	Blocked in all 12
All modules complete: one verified workshop plus self-marked/unverified second, or duplicate W1 joins	Blocked

Complete assessment workflow

An eligible learner chooses the optional soft-feedback route or direct final. Both lead to identifiable final work, approved pass/fail marking and controlled release.
Moodle may use supported native configurations; no specific plugin or number of activities is prescribed.

ID and confirmed rule	Implementation and acceptance test
A01 Instructions and dates	Explain both routes, submission requirements, criteria/rubric, soft date, hard deadline and time zone. Soft precedes hard and permits agreed feedback/revision time. Match instructions to due/cutoff/individual-extension settings. Exact dates, boundary handling and rubric remain pending.
A02 Soft submission	A fresh eligible learner submits formative work by the configured soft date. Staff can identify and retrieve the learner/file/timestamp and receive the feedback-needed alert. No summative pass/fail grade is released for formative work.
A03 Feedback and revision	Staff provide feedback; the correct learner receives feedback and notification, revises and submits identifiable final work by the applicable hard date. Demonstrate the complete sequence and staff retrieval of both stages. Editable or Not graded work alone does not prove this route.
A04 Final submission	Staff retrieve identifiable final work and mark it against approved criteria. Preserve the correct learner, file, timestamp and final state. Test final submission after revision and direct final; distinguish final submission from awaiting marking and released result.
A05 Direct final	Using fresh eligible learners, submit finally before the soft date and between soft and hard dates. No prior draft, feedback step or wait until the soft date passes is required. No automatic post-marking feedback/resubmission cycle is introduced.
A06 Individual extensions	An authorised facilitator can extend an individual hard deadline; other learners retain the original deadline. Test before, at and after original/extended boundaries and an unaffected learner. Show the applicable deadline in instructions/records. A hard extension does not automatically extend the soft-feedback window.
A07 Post hard deadline discretion	An authorised facilitator may permit a late/post-cutoff case. Demonstrate a permitted late submission that remains markable without a late penalty or automatic date-only failure. Confirm and test submission/access handling when permission has not been granted; do not invent automatic failure, penalty or universal late access. Late permission does not itself waive module/workshop eligibility.
A08 Pass fail and grade visibility	Test one final pass and one final fail against the approved standard. Authorised staff can mark/review; learners cannot see withheld summative results before the agreed release trigger. After release, only the correct learner and authorised staff see the outcome and final feedback. Numeric scores alone do not prove pass/fail. Ungraded/withheld states are distinct from failure; formative feedback remains available through A03.

Q01 Access records and state integrity

Test E01 through Moodle navigation and direct assessment links for both routes, including blocked learners. Messages identify unmet module/attendance conditions. Verify saved W1 – W3 states, qualifying count, module completion, eligibility and assessment states after refresh and logout/login. Learners see their own records; authorised staff see the agreed course records. One learner's completion, attendance, extension or grade must not alter another's.

Existing Done-based restrictions must use the verified qualifying attendance state before final acceptance. Show that self-marking cannot bypass the final restriction. Configure the all-module AND any-two expression, not the attendance rule alone. Repeated source capture must preserve the same distinct-workshop count. Exact synchronisation mechanism and update interval need supported configuration and confirmation.

Decisions scope and QA closure

Pending inputs and dependencies

Classification and owner	Required confirmation before affected signoff
Policy D-02/D-07 Riley + client	Required learning items and completion events for each module, self-check/pass/threshold rules and overall course-completion event. Neither displayed 75% nor 80% is approved by its presence in settings.
Attendance policy D-03 Riley + client/facilitator	Authorised recorder, source-to-learner matching, actual attendance verification policy, any duration rule if selected, correction/exception authority and process. Do not create a duration threshold while this is open.
Assessment policy D-04 Riley + client/facilitator	Dates/time zone and boundary/cutoff handling, feedback turnaround, stage retention, rubric/pass standard, release trigger, extension and late-case authority. Confirm treatment of missing late permission and any later attendance correction after work has been submitted; no automatic submission rejection or grade reversal is assumed.
Records D-05 Riley + OAPA staff	Practical staff view, audience, minimum useful fields and update interval. Distinguish pending/unverified from absent/failed; proposed exact fields are not already approved.
OAPA capability D-09/C1/C2 Aryan → Sam/OAPA	Clean isolated Academy copy, supported Teams source/integration or manual route, assigned facilitator permissions and fresh test accounts. Developers provide a specific blocked capability/reproduction; site permissions are not assumed.

Q02 Test execution and closure

Reshan and Zarin both implement/test and independently cross-test each other's changes. Use fresh actual Student-only and authorised facilitator accounts, controlled approved dates and a separate permitted course copy. Run W01 – W05, every E01 matrix case, A01 – A08 and Q01, including authorised/unauthorised override, duplicate capture and all deadline/release boundaries.

For each test retain criterion/gap ID, course/build, actual role and learner starting state, source or policy decision, date/time zone, expected/actual result, screenshot/log/record, fixer and independent retester. Record module inputs and workshop source used. Settings screenshots, historical attempts and interim Done tests cannot substitute for executed access/workflow tests. Unexecuted or

dependency-blocked cases remain open with owner/next action; full acceptance requires approved inputs and passing behavioural evidence.

Scope control

Preserve the existing framework and Moodle restrictions. No unapproved duration threshold, late penalty, date-only failure, compulsory soft stage, all-three attendance gate, automatic post-marking revision, eligibility waiver, structured peer review, custom plugin or wider reporting build is introduced. Automatic attendance is preferred only where supported; manual verification and authorised exceptions remain valid routes. Record approved changes and retest affected access and workflow behaviour.

Sources and traceability

- Task 63 Condensed Final Requirements and Acceptance Baseline: R04–R10/R11/R16.
