

H5P Interactivity Proof of Concept

Project: Building an Editor Academy Moodle Platform (Team 74, OAPA)

Owner: Dev 2, Shaikh Zarin Tasnim

Sprint: Sprint 1

[Quick note: we still don't have edit access on the actual OAPA Academy Moodle sandbox, so this proof of concept was built on a separate MoodleCloud test site set up by Dev 1 (Reshan) for the team to use for hands on testing. The H5P activity type and configuration itself is not tied to that site though, the same setup would work identically once we get access to the real OAPA sandbox.]

What I built

Built a single H5P activity called "Module Self-Check Template" using the H5P Question Set content type. This follows on from the recommendation in the earlier H5P feasibility note (built in mod_h5pactivity, ungraded self check use case). Instead of just a placeholder quiz, I put together a proper 7 question set mixing four different H5P question types, since a real reusable template should show course builders what is actually possible, not just the easiest option.

Question breakdown:

- 3 Multiple Choice questions, each with 4 answer options and individual feedback written for every option, not just "correct/incorrect"
- 2 True/False questions
- 1 Fill in the Blanks question, testing recall of the mod_h5pactivity / mod_hvp naming from the feasibility note
- 1 Drag the Words question, testing recall of Content Bank / Question Set terminology

All questions cover the same subject matter used throughout our H5P research (what H5P is, how it relates to Moodle Quiz, content types, reuse), so the whole activity doubles as a working example of a self check a real course could use, not just a technical demo.

Configuration evidence

Fig 1. First Multiple Choice question configured with all 4 answer options and per-option "Tips and feedback" text filled in, inside the Content Bank H5P editor.

Fig 2. Overall Feedback configured with 5 score-range tiers (0-24%, 25-49%, 50-79%, 80-99%, 100%), each with a distinct message so learners get graduated feedback depending on how they did overall, not just a pass/fail line.

Fig 3. Completed Question Set showing 7 questions in the progress indicator, confirming all question types (Multiple Choice, True/False, Fill in the Blanks, Drag the Words) were successfully added to the single activity.

Reusability

The activity was named generically ("Module Self-Check Template") rather than tied to specific course content, and it sits inside the Content Bank, which is the actual Moodle mechanism for reuse. Any future course builder can open the Content Bank, copy this H5P content into a different course, and just swap out the question text and answer options while keeping the same structure (4 option multiple choice with per-answer feedback, a mixed 4 blanks fill-in, a drag term matcher, and graduated overall feedback). That structure, not the specific questions, is the reusable part.

Completion tracking

Completion tracking was set to "Add requirements" with the specific condition "Receive a grade" and sub-condition "Passing grade", tied to the 50% pass percentage set on the Question Set itself. This was tested end to end using the student1 test account, not just configured and left unverified.

Fig 4. Course page showing the green "Done" completion badge next to Module Self-Check Template after student1 completed the activity and passed, confirming the completion condition fires correctly based on a real grade, not just a manual tick.

Feedback behaviour, tested as a real learner

Rather than only configuring the feedback text, I logged in as the student1 test account and actually completed the quiz twice (once with 1 question when it was first built, then again after expanding it to all 7), deliberately picking both correct and incorrect answers along the way to confirm every feedback path actually fires as expected.

Fig 5. Correct answer selected on a Multiple Choice question, showing the green highlight and the specific correct-answer feedback text displaying live.

Fig 6. Incorrect answer selected on a True/False question, showing the red cross and the specific incorrect-answer feedback text explaining why that answer is wrong.

What is H5P used for in Moodle?

Sending automated emails to students

Creating interactive content like quizzes and videos

✗ Grading assignments automatically

Close, but that's Moodle's Assignment or Quiz grading system. H5P focuses on interactive content, not grading workflows.

Managing student enrolments

You're just getting started, go back and review the material, then give it another try!

Retry

Fig 7. A wrong answer on a Multiple Choice question showing its individual feedback, together with one of the Overall Feedback score-range messages ("You're just getting started...") displaying underneath, confirming the score-range feedback system fires correctly based on running score, not just at the very end.

Other question types tested

Fill in the missing words

In Moodle, the built-in way to add H5P content is called `mod_h5pactiv...` ✓, while the older community plugin is called `mod_hvp` ✓.

2/2

Fig 8. Fill in the Blanks question completed correctly (2/2), both blanks filled with the right terms and marked with green checkmarks.

Drag the words into the correct boxes

H5P content is created and organized through Moodle's , and the specific tool used to build quizzes with multiple question types is called the .

Fig 9. Drag the Words question before answering, showing the draggable word chips ("Content Bank", "Question Set") ready to be placed into the blanks.

Drag the words into the correct boxes

H5P content is created and organized through Moodle's , and the specific tool used to build quizzes with multiple question types is called the .

Fig 10. Drag the Words question completed correctly (2/2), both words placed and marked correct.

Learner progress and reporting

Investigated Moodle's built-in "Attempts report" tab on the H5P activity, which lists participants and their results, filterable by first/last name. Before any real attempt existed, it correctly showed "No participants to display" rather than erroring, confirming the reporting feature itself is in place and working, just waiting on data. After student1 completed the activity, a real attempt was recorded and visible through both the activity's own results screen and the course completion status.

H5P Question Set results always automatically sync with Moodle's native Quiz gradebook.

☐ True
 ☒ False ✓

Correct, H5P and Moodle Quiz are separate systems. An H5P activity has its own grading and completion tracking, it doesn't automatically feed into a Quiz activity's gradebook.

★ 1/1

[Finish](#)

Fig 11. Final question of the set answered correctly, with the "Finish" button now available to submit the full attempt.

Results		9 of 9 correct
Question	Score	
Untitled Multiple Choice	1/1	
Untitled Multiple Choice	1/1	
Untitled Multiple Choice	2/2	
Untitled True/False Question	1/1	
Untitled True/False Question	2/2	

[Show solution](#)
[Retry](#)

Fig 12. Final Results screen after completing all 7 questions as student1: 9 of 9 correct (some questions worth 2 points each), with a full per-question score breakdown table. This is the strongest single piece of evidence that the whole activity, all four question types, the feedback system, and the scoring, works correctly end to end.

Limitations and dependencies

- This was built on a separate MoodleCloud test site (localtestsite.moodlecloud.com), not the actual OAPA Academy sandbox, since our Course Creator account on OAPA Academy currently has student-level access only and cannot add or edit activities. The configuration steps and H5P

behaviour documented here should transfer directly once real edit access is granted, but this has not been confirmed on the actual OAPA instance yet.

- Attempts made by a Course Creator / teacher account register as "preview mode" and do not count as real tracked attempts or trigger completion. All completion and reporting evidence in this document was generated using the separate student1 test account, not our own admin login.
- H5P activity libraries need to be available on the server (either bundled with Moodle core for mod_h5pactivity, or downloaded from h5p.org for individual content types). This was not an issue on the MoodleCloud test site, but it is worth confirming the OAPA Academy sandbox has the needed H5P libraries once we have access.
- As noted in the earlier feasibility note, H5P scoring can be manipulated by a learner with some technical knowledge, so this activity type should stay limited to ungraded self checks, not formal assessment, regardless of which Moodle instance it is deployed on.
