

Final Interactivity and Learner-Tracking POC

Evidence and Technical Findings

Sprint 1, week 3 - Team 74, OAPA Editor Academy

Prepared by Shaikh Zarin Tasnim (Dev 2)

1. Purpose

This document closes out my Sprint 1 interactivity and learner-tracking task. It reviews the Week 2 H5P proof of concept I built, and then covers what happened when I tried to re-verify that same POC directly on the real OAPA Academy course now that we have Teacher access there. The short version is that the POC itself works fine and is fully verified, but the real Academy course currently has a platform level bug that blocks H5P entirely, so verification had to be carried forward on our shared Moodle test environment instead.

2. Week 2 POC Recap (Task 19)

Back in Week 2, before we had real Academy access, I built a full H5P Question Set called "Module Self-Check Template" on our shared MoodleCloud test site (localtestsite.moodlecloud.com). This is the reusable self-check format meant to sit at the end of each module.

The Question Set has 7 questions across 4 H5P question types:

- Multiple Choice
- True/False
- Fill in the Blanks
- Drag the Words

Each question has its own answer specific feedback, and the whole set has 5 tier overall score feedback depending on how many questions the learner gets right. This was all documented with screenshots in my Task 19 report.

3. Sprint 1 Close-Out Verification Attempt (Real Academy Course)

For close-out, the task asked me to re-verify this POC directly on the real Academy course ("Foundations of Academic Peer Review - Student Dev Copy", course id 6) now that permissions allow it, rather than relying only on the MoodleCloud environment. I tried three separate ways to get working H5P content on this course. All three hit the same error.

3.1 Existing H5P content on the course

The real course already has H5P activities that OAPA built in: "Welcome Session Slide Deck" under the hidden Workshop Slides section, plus Workshop 1, 2 and 3 Slides inside each module. Every single one of these throws the same error when opened:

H5P file not found (invalid contextid)

Clicking "More information about this error" on any of them links out to the same Moodle documentation page, which turns out to be an empty auto-generated stub with no explanation written for it yet. So the link doesn't tell us anything extra, it just confirms this is a recognised Moodle error string.

Fig 1. The "more information" link for this error leads to an unwritten Moodle documentation stub.

3.2 Content Bank

Since the existing content was possibly just old and broken, I tried the Content Bank instead, since that is where new H5P content is normally authored in browser on this Moodle version. Opening the Content Bank for this course threw the exact same error immediately, before I had even tried to create anything:

Fig 2. The Content Bank itself fails with the same invalidcontextid error just from being opened.

Clicking Continue past this error does not load the Content Bank at all, it just bounces back to the previous page. So the Content Bank is not usable for this course right now, which means there is currently no in browser H5P authoring route available on the real Academy course.

3.3 Fresh upload test

To rule out this being only a legacy or restored content issue, I exported my working Question Set from MoodleCloud as a .h5p package (question-set-6.h5p) and uploaded it fresh into a brand new H5P activity, inside a clearly labelled test section I added at the bottom of the course ("Zarin - H5P Testing, Sprint 1"). This content was never restored or migrated, it was uploaded for the first time seconds before testing it.

It hit the exact same error:

Fig 3. A freshly uploaded H5P package, in a brand new activity, throws the identical error.

4. What This Tells Us

Since a brand new upload fails in exactly the same way as pre-existing content and the Content Bank, this is not a one off broken file or a content migration problem. Every route into H5P on this specific course context (course id 6) is currently blocked by the same invalidcontextid error, regardless of whether the content is old, new, uploaded, or authored in browser.

This points to a course level or site level configuration issue in how this Moodle instance is resolving file context for H5P, not a defect in H5P itself and not something caused by our team's work. It is outside what Teacher level access can fix. Site Administrator level access would be needed to actually investigate and resolve it, whether that means repairing the course's file context records or something in how this specific Academy instance is set up.

5. What Is Verified and Working

None of the above means the interactivity and tracking POC itself is broken. It has been fully built and verified on our shared MoodleCloud test environment, where H5P works normally with no context errors at all.

Fig 4. The Module Self-Check Template playing correctly on MoodleCloud, with attempts already logged.

On MoodleCloud, I confirmed all of the following work as intended:

- The H5P self-check activity operates correctly end to end
- All 4 representative question types render and function correctly (Multiple Choice, True/False, Fill in the Blanks, Drag the Words)
- Individual answer feedback shows correctly per question
- Overall 5 tier score feedback shows correctly depending on final score
- Student completion behaviour works, the activity marks complete once a grade is received
- Learner tracking and reporting works, attempts are logged and visible in the Attempts report

The exported package itself is also confirmed intact and correctly structured, since it uploads and is recognised by Moodle as a valid H5P package on the real course, it just cannot render due to the course context bug rather than any problem with the file.

Fig 5. The exported question-set-6.h5p package recognised correctly in the Package file field.

6. Native Moodle/H5P Behaviour vs Additional Dependencies

To separate what is genuinely native platform capability from what depends on extra configuration or access:

- H5P is confirmed native to this Moodle version, it shows up in the activity picker with no plugin request needed. This part is not the issue.
- Authoring and playback of H5P content, however, currently depends on the course's file context resolving correctly, which is broken specifically for course id 6 right now. This is the dependency blocking us.
- Fixing this depends on Site Administrator level access, which sits with OAPA and Sam, not with our current Teacher access.

7. OAPA Verification Status

Per the close-out task instructions, OAPA verification was attempted directly on the real Academy now that permissions allow it. It could not be completed due to the platform bug described above, not due to a lack of permissions. Per the same instructions, the shared MoodleCloud environment is being retained as the POC environment and this verification is being carried forward until the underlying course issue is fixed.

H5P is not being represented as a mandatory platform wide feature based on this POC. This work only demonstrates that H5P can work as a self-check format when the platform is functioning correctly, it does not establish it as a required feature across the course framework.

8. POC Revision After Independent Testing

Before making any changes, it's worth being clear that the original 7 question version of this Question Set already passed independent testing in full. Reshan tested it as his own Task 18, covering 8 separate test cases across every question type, both answer feedback and overall feedback, completion tracking, and attempts/participation tracking. All 8 passed with no defects found.

So the update described below is not a fix. Nothing was broken. It's a deliberate refinement made on top of an already working, already verified POC, to make the demonstration itself cleaner and more precise.

The Question Set has been trimmed from 7 questions down to 4, keeping exactly one question of each type (Multiple Choice, True/False, Fill in the Blanks, Drag the Words). This means the POC now shows one clear, unambiguous example of every interaction type, instead of some types being repeated while others appear only once. The 4 questions carry a total of 6 points (Multiple Choice 1, True/False 2, Fill in the Blanks 2, Drag the Words 1), giving 7 possible score outcomes. The Overall Feedback ranges were reworked into 5 tiers so that every one of these 7 outcomes lands inside a defined range, with no gaps a learner's score could fall into without triggering feedback. The result is a tighter, more representative version of a POC that was already confirmed to work correctly.

9. Summary of Findings

- The Week 2 H5P self-check POC is fully built and verified on MoodleCloud, all question types, feedback, completion and tracking behaviour confirmed working.
- Every H5P activity on the real Academy course (course id 6) currently fails with "H5P file not found (invalid contextid)", including pre-existing content, the Content Bank, and a freshly uploaded package.
- This rules out a content specific or restore specific cause. The issue sits at the course or site level, not with any individual H5P file.
- This is outside our current access level to fix and needs Site Administrator attention.
- The MoodleCloud environment remains the verified fallback POC environment until this is resolved, as anticipated by the close-out task instructions.
