

Reusable OAPA Course Template Requirements & Acceptance Criteria

1. Template Model

The reusable OAPA course template should provide a standard structure that can be duplicated for future courses without rebuilding the course framework.

Standard learner structure:

Module 1 + Workshop → Module 2 + Workshop → Module 3 + Workshop → Assessment

The template should provide reusable areas for learning resources, activities, quizzes/self-checks, peer interaction and workshop information. Course builders should primarily insert or replace content within this existing structure rather than recreate the course design. This reflects the client's stated intention for the same framework to be reused across journal editing, peer review, academic writing and later course levels.

2. Functional Requirements and Acceptance Criteria

ID	Requirement	Acceptance Criteria
CT-01	Reusable master template – A standard OAPA course template must be available for creating future courses.	An authorised course builder can duplicate the template to create a new course without changing the original.
CT-02	Three-module structure – Standard courses must contain three asynchronous learning modules followed by a separate assessment phase.	A new course created from the template contains Module 1, Module 2, Module 3 and an Assessment area in the approved order.
CT-03	Consistent module layout – Each module must use a predictable reusable internal structure.	Each module provides defined locations for learning resources, activities, formative/self-check content, peer interaction and workshop information.

ID	Requirement	Acceptance Criteria
CT-04	Sequential progression – Learners must complete the required preceding module before progressing to the next.	Module 2 cannot be accessed until Module 1 completion requirements are met, and equivalent progression rules can be applied to later modules.
CT-05	Progress visibility – Learners must be able to understand their completion status and next required stage.	Activity/module completion and overall progress are visible and the learner can identify what must be completed next.
CT-06	Reusable learning resources – Course builders must be able to insert varied learning materials without redesigning the template.	Each module supports appropriate Moodle resources such as pages, media/video, links and other approved learning resources.
CT-07	Reusable activities and quizzes – The template must support reusable interactive and formative activity areas.	Course builders can add or replace quizzes, self-checks, discussions and other suitable Moodle activities while retaining the standard module structure.
CT-08	Module workshops – Each learning module must support an associated live interactive workshop.	Each module provides a standard area for workshop details, date/time, joining information, supporting resources and recording access where applicable.
CT-09	Timezone-aware workshops – Workshop information must support OAPA's international learner model.	Learners can clearly identify the correct session time for their workshop stream and access it through the course environment.
CT-10	Workshop attendance – Attendance must be capable of contributing to assessment eligibility.	The system can record whether a learner has attended the required workshops and use that status when determining assessment access.
CT-11	Assessment eligibility – Final assessment must not be available	A learner who has not met the required eligibility conditions cannot

ID	Requirement	Acceptance Criteria
	until the required participation conditions are satisfied.	access the assessment; an eligible learner can.
CT-12	Minimum workshop requirement – Credential-seeking learners must attend at least two of the three workshops before undertaking the assessment.	Assessment access remains restricted until attendance at at least two workshops has been recorded.
CT-13	Assessment area – The template must provide a reusable final-assessment area.	Course builders can insert assessment instructions, submission requirements, marking criteria and relevant dates without rebuilding the assessment structure.
CT-14	Two-stage assessment support – The template must accommodate OAPA's soft-deadline and hard-deadline workflow.	The course can support formative submission/feedback before the soft deadline and revised or direct final submission by the hard deadline.
CT-15	Course-builder workflow – Creating a future standard course should primarily involve inserting content into the established framework.	A course builder can duplicate the template, replace placeholder content and configure activity details without recreating the standard sections, navigation and progression model.
CT-16	Responsive and accessible structure – The reusable template must remain usable across supported devices and accessibility methods.	Core template navigation and content structure function on desktop, tablet and mobile and can be tested for keyboard/accessibility compatibility.

3. Course-Builder Workflow

The intended future workflow should be:

1. Duplicate the approved master template.
2. Name and configure the new course.
3. Insert OAPA-provided content into the existing three-module structure.
4. Select/configure appropriate activities, such as quizzes or discussions.
5. Add workshop information for each module.
6. Configure progression and assessment conditions.
7. Review and publish the completed course.

The academic content remains OAPA's responsibility; the template should provide the reusable framework into which that content is inserted.

This is preferable to requiring future course builders to decide repeatedly:

- how many sections to create;
- where quizzes belong;
- how workshops are presented;
- how progression works; or
- how the final assessment area should be structured.

4. Open Design Decision – Micro-Credential Flexibility

Alternative course structures

The standard reusable template should presently be designed around the confirmed three-module + assessment model.

However, the required flexibility for future:

- micro-credentials;
- shorter courses;
- omitted modules;
- reordered modules; or
- alternative course lengths

has not yet been sufficiently confirmed.

The earlier specification proposed a flexible template in which phases could be hidden, removed, reordered or modified, while the later client discussion strongly emphasised a consistent three-module reusable framework.

Decision required: Confirm whether micro-credentials should:

- use the same template with modules/phases hidden or removed; or
- use a separate simplified template.
